

Reflect - Activity 3

Demonstrate:

During demo 4, the mud area has an extremely high cost of 20, with water being at 3. When moving the target cube around, the character have a preference to use the water area to get to it instead of going through mud, as shown in the video where the character rather go through the longer water section than the short mud section (unless the target is very close to the end point of the mud area).

Scale:

7 for hard

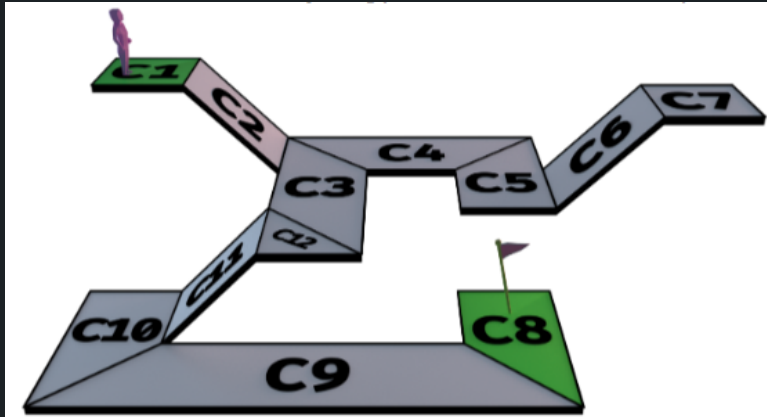

Challenging:

Figuring out how to link the area's costs requires much research.

Least challenging:

Baking the initial path for the character to move on, as well as adding obstacles to the path.

Upon a re-watch:

There isn't a video reference for this, only a picture of the terrain. For that, I think I did well replicating the paths shown in the picture.

This activity was very useful, since knowing how to utilize NavMesh can let me, as well as my team, easily implement smart and dynamic movements for various NPCs/moveable objects.

Some things I might consider for this activity is to adjust how the character moves, like slowing down during turns and lerping the rotation. This will make the character feel more organic when traversing the areas.

This could work well for enemies that need to be "smart" in our GDW game, so that the player can be more strategic about how they stealthily sneak past them, or outrun them.
